1	<u>ABSTRACT</u>
2	The instant invention involves the use of a combination
3	of preparatory steps in conjunction with mass spectroscopy
4	and time-of-flight detection procedures to maximize the
5	diversity of biopolymers which are verifiable within a
6	particular sample. The cohort of biopolymers verified within
7	such a sample is then viewed with reference to their ability
8	to evidence at least one particular disease state; thereby
9	enabling a diagnostician to gain the ability to characterize
10	either the presence or absence of said at least one disease
11	state relative to recognition of the presence and/or the
12	absence of said biopolymer.
